# mister-keeper

Build an app for keeping notes (reference app "google keep").

The main page will show a list of the user's notes, and a button for adding a new note.

Each note should have the following:

- Id
- Title
- Text
- Image
- Color
- Priority
- Date of creation (timestamp)

The user can view each note, edit and delete them.

When clicking the X button an alert should show "Are you sure you want to delete this note?"

When clicking a note, route to NotePage it allows viewing and editing.

1) Implement a full CRUDL (create, read, update, delete, list).
2) You should write the service in async way. All your operations need to be based on promises (not only the query for data, all the other CRUD operations).
3) Implement sorting by time and by priority.
4) As always, make it look good and responsive to all devices.
